

# GridTracker v1.20.0906

September 6th, 2020

This is a major update!

Windows security permissions on media-file (mp3) playback was previously asking for full rights to your soundcard and webcam. It will now only request access to the soundcard for playback.

Framework update (NWJS.io) for Windows.

U.S. NexRad was not refreshing every 10 minutes as expected.

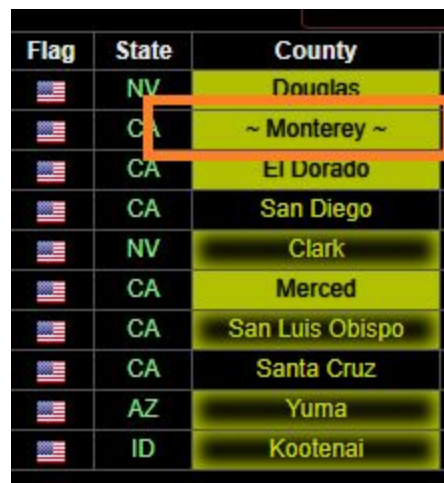

All windows now save and restore opened/closed state.

All windows now resize.

All windows now support zoom/scale control: **ctrl-minus**, **ctrl-plus**, **ctrl-zero**.

The "**Band Activity Graph**" pop-out no longer hides if you minimize the main window.

US Counties overhauled. Unqualified counties now appear with "~" around them to indicate GT is unsure which is the correct County.

Flag	State	County
	NV	Douglas
	CA	~ Monterey ~
	CA	El Dorado
	CA	San Diego
	NV	Clark
	CA	Merced
	CA	San Luis Obispo
	CA	Santa Cruz
	AZ	Yuma
	ID	Kootenai

An unqualified County is when a U.S. callsigns ZIP code (the only information I have at this time), belongs in more than one County. The county displayed in the "**Call Roster**" is the first "**unworked**" or first "**unconfirmed**" County in that ZIP code.

**Left-click the unqualified County name once to do a lookup.**

If the selected County is found by your “**lookup service**” and correctly identified, it will adjust the “**Call Roster**” entry and remove the “~” approximation markers. It may disappear from the “**Call Roster**” depending on your “*Wanted*” and “*Exception*” flags.

Callsign lookups are now cached for up to seven days, with a new row in the “*Details*” table that gives you the date of last lookup. Any callsign entered manually at the top of the lookup window will go directly into your “**lookup service**” bypassing the cache, and store or update the cache in the process.

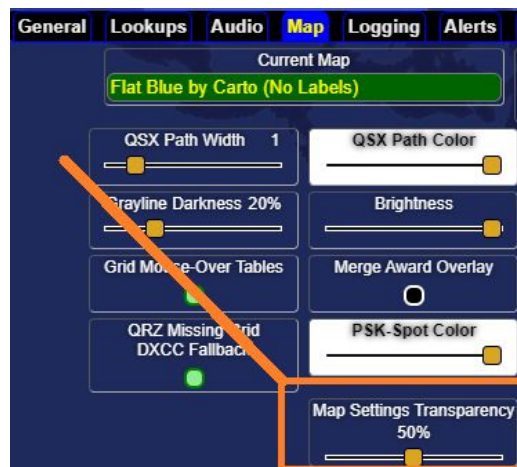

“*Internal Data*” files are no longer stored in ~\Documents\GridTracker\data.

The maximum “Q-Paths” animation frame rate has been reduced to 1/2 your current display refresh rate.

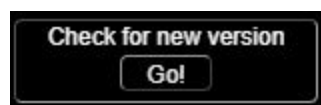

Faster decoded grid validation.

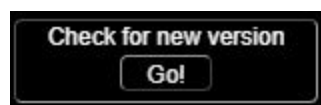

Added “Satellite Map” as a new offline map, and it is now the default for offline mode..

“**Map Settings**” transparency can now be set to your liking with a new slider.

From this version forward; **Beta** releases may be available before they are promoted to a stable release. Users will not be automatically notified of **Beta** releases.

You must now open Settings and click on  to check for either a new version (if you’ve checked the “Stop Asking?” button in a previous update notification), or for a new **Beta** release.

Thank you for reading the entire update!
